

# Web page

HTML, CSS

Your client has a web domain where they want to present the material included in the folder (images and texts.)

Deliver a link to a GitHub repository with your solution on Tuesday.

## Required Features:

- All the material in the folder must be used.

## Code Requirements:

- You are ready once the user can load a file called "index.html" and thereby get access to all the other material in the folder through the web browser. It's up to you to arrange the material on one or several web pages.
- There are no other rules.
